The Pendulum GPS-12R and the top-of-line High-Stability GPS-12R/HS Portable Frequency Reference clocks are ultra-stable, low-noise, GPS-disciplined Rubidium references, and ideal reference sources and calibrators for both telecom instrumentation and general lab equipment. Thanks to the internal battery option, you can transport near-Cesium frequency stability to the field without losing accuracy.

## Metrology & Telecom Applications

The GPS-12 series consist of very precise GPS-controlled Rubidium reference clocks for various telecom applications. In its standard configuration, the two front-panel outputs can be set to either 1.544 MHz (T1) or 2.048 MHz (E1) reference clock outputs, for calibration or synchronization of test instruments and network elements. The 1 PPS front-panel output provides an ultra-stable timing reference, with excellent hold-over specifications. This is useful in applications where timing is critical, like synchronization of DAB, DVB or WCDMA transmitters or for synchronization of radar antenna array systems.

GPS-12R can be used as a permanent reference clock in the telecom network, as per PRC specifications, in GPSlock, or in hold-over mode during 24 h. The High-Stability GPS-12R/HS model is targeted for metrology applications with its low noise 5/10 MHz sine outputs, and its ability to phase step the 1 PPS timing output.

## Optional Configurations

In addition to the standard E1/T1 and 1 PPS/10 MHz square wave outputs, the GPS-12 family can accommodate two additional rearpanel option boards with the following I/O characteristic:

- **Option 70B:** One 5 MHz and three 10 MHz low-noise outputs for test systems or metrology applications. This option is mounted as standard in the GPS-12R/HS model.

- **Option 71B:** Four sine wave outputs of 10 MHz, 5 MHz, 1 MHz and 0.1 MHz.
- **Option 79/01:** Two 10 MHz and one 1 PPS outputs, together with an 1 PPS input for external disciplining.

## Truly Portable and More

The GPS-12 family models are compact, lightweight and has an internal battery option to maintain stability during transportation or to allow field use without access to AC mains. For the first time, it is possible to transport an atomic frequency standard into the field and have instant access to the full stability, with zero warm-up time.

When ordered with the low-noise 5/10 MHz outputs (standardly included in GPS-12R/HS), these models provide a portable reference clock for ALL kinds of instrumentation. They can also be used as ultra-stable in-house frequency reference for R&D, test systems, or manufacturing. User settings and display are selectable for six languages, and the optional GPS-12 Monitor allows full remote control and monitoring of the instrument. The GPS-12R and GPS-12R/HS are excellent metrology references for calibration of test equipment such as Wandermeters, SDH/SONET network analyzers, and general test and measurement equipment time bases.
